

## PRACTICAL NO: 2A

**Aim:** Perform Data Loading, Feature selection (Principal Component analysis) and Feature Scoring and Ranking.

**Code:**

```
from pandas import read_csv

from sklearn.decomposition import PCA

from sklearn.ensemble import ExtraTreesClassifier

#We will use PCA to select best 3 Principal components from Pima Indians Diabetes dataset.

path = 'pima-indians-diabetes.csv'

names = ['preg', 'plas', 'pres', 'skin', 'test', 'mass', 'pedi', 'age', 'class']

dataframe = read_csv(path, names=names)

array = dataframe.values

#Next, we will separate array into input and output components –

X = array[:,0:8]

Y = array[:,8]

#The following lines of code will extract features from dataset –

pca = PCA(n_components=3)

fit = pca.fit(X)

print("Explained Variance: %s",fit.explained_variance_ratio_)

print(fit.components_)

#From the output, we can observe that there are scores for each attribute.

#The higher the score, higher is the importance of that attribute.

model = ExtraTreesClassifier()

model.fit(X, Y)

print("Scores for each attribute")

print(model.feature_importances_)
```

#Rank

```
dataframe["BMIRanking"] = dataframe["mass"].rank(ascending=False).astype("int")
```

```
print(dataframe.head()) #prints the first 5 rows.
```

**Output:**

```

1. Describe the use of diagram using principle of PCA
2. Explain procedure for computation of principle of datas

## PRACTICAL NO: 2B

**Aim:** For a given set of training data examples stored in a .CSV file, implement and demonstrate the Candidate-Elimination algorithm to output a description of the set of all hypotheses consistent with the training examples.

**Code:**

```
import csv

with open("tennis.csv") as f:
    csv_file=csv.reader(f)
    data=list(csv_file)

s=data[1][:-1]
g=[['?' for i in range(len(s))] for j in range(len(s))]

for i in data:
    if i[-1]=="Yes":
        for j in range(len(s)):
            if i[j]!=s[j]:
                s[j]='?'
                g[j][j]='?'

    elif i[-1]=="No":
        for j in range(len(s)):
            if i[j]!=s[j]:
                g[j][j]=s[j]
        else:
```

```

g[j][j]="?"

print("\nSteps of Candidate Elimination Algorithm",data.index(i)+1)

print(s)

print(g)

gh=[]

for i in g:

    for j in i:

        if j!='?':

            gh.append(i)

            break

print("\nFinal specific hypothesis:\n",s)

print("\nFinal general hypothesis:\n",gh)

```

### tennis.csv file
